1 Why you must know?

High Voltage would be a threat to your safety

The common high-wattage appliances in our home, such as air conditioners, refrigerators, TV, socket, power strip, and more, are high voltage devices.

High voltage is more dangerous than low voltage. Low voltage refers to the lines that transmit the signal, while the high voltage lines transmit electric power.

The human body safety voltage is 36V and lower. In a wet environment, the safety voltage is 24V, or even 12V.

Also, what is the voltage of the above-mentioned appliances at home? They are 230V, 220V, or 110V, which greatly exceeds the human body safety voltage. Therefore, an electric shock always leads to injury or death.

Akubela smart home products are high voltage devices

To avoid fire, personal injury, or death, you must follow the safety rules strictly before and when proceeding.

What to do in case of an electric shock?

What to do in case of an electric shock?

1. Turn off the source of electricity as soon as you can.

2. Use an insulator object (e.g., a wooden or rubber stick) to remove the wires from the injured person. Do not touch the person receiving electric shock before you ensure the source of electricity is off.

3. Call your local emergency services. If necessary, begin CPR for the person.

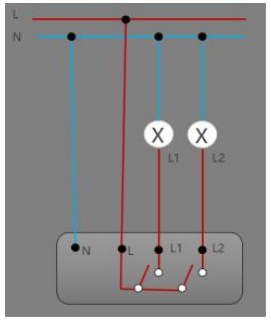
3 Cautions of Testing Akubela Devices

Cautions of Testing Akubela Devices

1. Check the voltage requirements.

2. Unplug the device and wire it according to the wiring diagram.



1. The exposed electric wires are dangerous. You have to use insulation tape to stick the exposed ends.

2. When the device malfunctions, power it off before doing troubleshoot.
